Memo: Using 988 training feedback to evaluate and improve EveryMind's trainings

To: EveryMind training and program staff · From: Team 17

Key findings

1. **After training, participants feel ready.** Of 1,299 respondents:

– 89.9% agree they can identify a mental health crisis;

– 90.5% agree they can describe 988;

– 92.3% agree they know when to use it.

2. **The biggest gains are 988-specific, not general crisis awareness.** In their recalled "before" ratings:

– only 46.5% could describe 988, and 55.7% knew when to use it;

– 72.2% already felt able to identify a crisis.

On a 1–5 scale, self-rated change was +1.1 points for describing 988 and +1.0 points for knowing when to use it, against +0.5 points for identifying crises. *Caution: the "before" ratings were asked after the training, which tends to overstate change.*

3. **The main gap is enthusiasm, not knowledge.**

– Students (1,080 respondents) report about the same knowledge as everyone else: 89.5% can identify a crisis.

– But they rate the training much lower on "would recommend": an average of 7.2 out of 10, against 9.5 for school staff and 9.5 for caregivers.

– The same pattern shows by county: 7.1 in Anne Arundel against 8.7 in Prince George's.

These gaps are well outside the margin of error.

4. **Presenters are rated highly**, with 88.2% to 91.8% agreeing on engagement, knowledge and organization. About 1 in 8 respondents skipped these questions (151 blanks on engagement).

5. **We know little about whether people would actually call 988.** Only 293 respondents answered that question (average 7.7 out of 10). This is the outcome that matters most, and it is the least measured.

6. **Thin findings, flagged:**

– Spanish-language respondents (19) and Queen Anne's County (12) are too few to compare reliably.

– Other out-of-state and small counties are not reported separately.

7. **What participants wrote.**

– Learning what 988 is was the most-valued lesson, named in 46.8% of the 1,063 "most valuable" comments.

– The biggest "improve" theme is not a complaint. 35.2% of the 651 improvement comments were questions about 988 itself, which shows unmet demand for Q&A time.

– Requests for more interaction (4.8%) or more examples (3.5%) are rare.

Methodology

• **Preparation.** We cleaned all survey responses with documented mapping tables. These unify county spellings (for example, six versions of "Montgomery"), answer-label variants ("Very agree", "Satisfied"), stray spaces and multi-select roles. Labels the tool doesn't recognize are flagged, never silently dropped.

• **Measures.** "Agree" means Agree or Strongly agree. Every number states its base, and percentages carry confidence ranges.

• **Small groups.** Any group under 10 people is hidden or pooled.

• **Checks.** Every headline number was recomputed by separate, independently written code, and it matched the pipeline on every metric it covers. A team member also recomputed 20 headline numbers by hand in Excel, and all 20

matched.

Recommendations (in priority order)

#	Action	Owner · frequency	Needs	Impact measure
1	**Measure behavior intent for everyone.** Make the call-988 question required and add a true pre-survey (3 questions at the start of the session).	Evaluation lead · once, then every session	Survey edit (~1 hour)	Call-988 response rate; gains measured without recall bias
2	**Redesign the student session for engagement.** Pilot a format with built-in Q&A time in Anne Arundel schools, since a third of improvement comments are open questions about 988.	Training manager · next semester	Facilitator time, one pilot school	Student recommend score; compare pilot vs non-pilot
3	**Run the dashboard after every training season**, and use it for grant reports.	Program coordinator · monthly + each season	The survey export, a web browser, ~2 minutes	Report turnaround; grant reports citing it
4	**Reach and hear smaller communities.** Collect at least 30 responses before judging a county or a language group; offer the Spanish survey actively.	Outreach lead · ongoing	Survey links per partner	Number of groups with $n \geq 30$
5	**Fix the survey form**: county as a dropdown, one answer scale for all items.	Evaluation lead · once	Survey edit	Label variants and blanks fall to zero

Implementation

- **Who and when:** a program coordinator, once a month and at the end of each training season.
- **Steps:** open the dashboard website (team17-everymind.vercel.app), click **Update with a new survey export**, and drag in the Excel export. In about a minute it rebuilds everything: cleaned data, findings, comment themes and the dashboard, which can be downloaded as one file for staff and funders. No installation or coding.
- **What it handles:** new counties, new answer labels and extra rows are flagged rather than breaking the tool.
- **Privacy:** the export is processed inside the browser and is never uploaded. Only group totals appear in outputs.

Limitations

- **Self-report:** ratings measure confidence, not skill or behavior.
- **Recalled "before" ratings:** the before scores were asked after training and likely overstate gains.
- **Who answered:** 83.1% are students and 72.1% are from Anne Arundel, so results describe them best.
- **Missing answers:** about three in four skipped the call-988 question, and about one in eight skipped the quality questions.
- **Possible misread scale:** 31 respondents chose "Strongly disagree" on every knowledge item. Excluding them raises crisis-identification agreement from 89.9% to 92.1%, so the headline numbers are, if anything, conservative.
- **No comparison group.**
